

The Latest Technology in Colorectal Cancer Screenings.

New Colonoscopy Can Detect Hard to Find Lesions

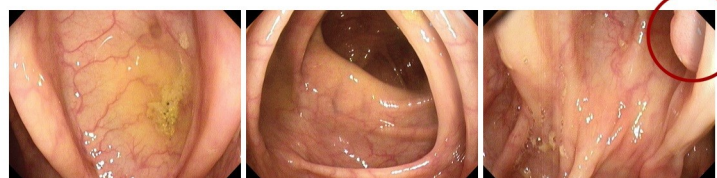

Scarsdale Medical Group is the first in Westchester County to use the Fuse endoscopy system, the latest technology in colorectal cancer screening. This system allows our gastroenterologists to see nearly twice the anatomy of the GI tract.

Traditional Scope VS. Fuse Scope

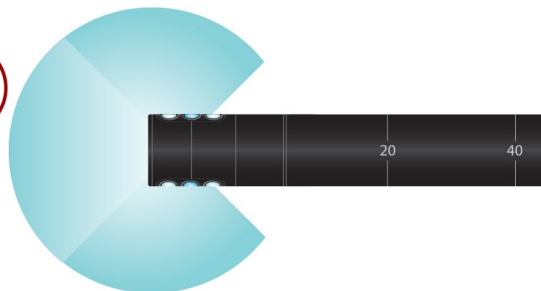

Traditional Colonoscope

Limited 170° Field of View

Fuse® Colonoscope

Panoramic 330° Field of View

The Fuse endoscope system uses three small cameras at the tip of a flexible GI endoscope providing a panoramic 330-degree view of the colon. We are able to potentially find a significantly higher number of pre-cancerous polyps than with a traditional, forward-viewing scope.

Fuse colonoscopy is covered by insurance in the same way as a standard colonoscopy.
